

## ABSTRACT

In a still image shooting mode, when a user does not specify a position of an AF frame, an AF process is performed for an AF region of a comparatively large range whose center is in a center of a shooting frame. When the user taps on any position in an EVF area, a touch panel superimposed on a display detects its coordinates. An AF region smaller than the AF region when the user does not specify the position of the AF frame is arranged so that a center of the AF frame is on the coordinates. The AF process is carried out for the smaller AF region. When the user taps on the EVF area 221 twice at a short predetermined interval, a PDA returns the AF region to a state where the position of the AF frame 261 is not specified by the user.
